## HOW TO RE-STRING THE DIAL MECHANISM

FOLLOW THE DIRECTIONS BELOW IN THE ORDER OUTLINED.

1. Prepare a dial string about 2.5 meters long (8 feet 6 inches).
2. Tie one side of the string to the tension spring, leaving about 10 cm (4 inches) of the string end free.
3. Set the tuning capacitor to fully open position (minimum capacity, plates unmeshed). Then lock the tuning capacitor drum to the shaft at a point where the grooved slit for hooking the tension spring (see diagram) is about 10 degrees to the left of the top of the drum.
4. Hook the free end of the tension spring to the hole in one of the drum spokes as shown. Now fully extend the tension spring and hook its stringed end to the grooved slit.
5. Lead the string in the direction of 1 (see diagram), wind it three times around the tuning shaft as shown, and guide the string along 2 to 5, passing it through the bottom groove of the variable capacitor drum on the way.
6. The string should then be led back to the top side of the drum and wound around it twice just behind the string from 5. Then tie the two ends of the string together.
7. Unhook the stringed end of the tension spring from the grooved slit. This will cause the tension spring to contract and tighten up the string circuit.
8. Set the variable capacitor to maximum capacity (plates fully meshed) and temporarily line up the dial pointer with the marker at the left hand of the dial glass.
9. Tune in a station and then permanently attach the pointer to the string so that it indicates the frequency of that station accurately.

# HOW TO REPLACE THE METERS

When necessary, the SIGNAL, TUNING or MULTIPATH meters can be removed for repair or replacement as follows.

1. Remove all knobs from the front panel of the T-100. (TUNING plus 5 others on the sub-panel).
2. Remove the Top Plate. (Do not misplace the nylon washers).
3. Remove one screw each from the left and right side panels. These screws are located at the upper end, adjacent to the front side. These are the screws that hold up the front panel assembly.
4. Remove the two front panel screws No. 44 (Ex-

ploded view: page 4) which hold the front panel assembly in place from the frontside.

5. Remove the two screws that are affixed to the front panel assembly from the bottomside.
6. Now remove the front panel assembly itself.
7. Remove the metal plate holding the meter in place. This is No. 25 for the Signal meter and No. 26 for the Multipath meter on the assembly Exploded view on page 4.
8. Replace or repair meter.
9. Reattach meter and front panel assembly in reverse order, as explained above, starting from step 7.

# CIRCUIT DESCRIPTION

## T-100 ALIGNMENT INSTRUCTIONS

All ACCUPHASE tuners are carefully aligned and tested at the factory using the finest available test equipment.

All ACCUPHASE tuners will meet their published specifications when shipped from the factory.

After extensive operation, or servicing, it may be desirable to realign the tuner circuits for best performance. The alignment charts give complete information on the circuit realignment procedure for the T-100.

The test equipment listed (or it's equivalent) is necessary to properly align a T-100. The accuracy of the alignment will be directly related to the accuracy and calibration of the test equipment used.

If the necessary test equipment is not available, alignment should not be attempted. For additional information contact Technical Service Department of our ACCUPHASE Distributor.

## TEST EQUIPMENT REQUIRED

1. FM Signal Generator (Measurements 188 or equivalent)
2. AM Signal Generator (Measurement 65B or equivalent)
3. VTVM
4. Multiplex Generator (Radio meter SMG 1, or equivalent)
5. 10.7MHz Generator (Preferably crystal controlled)
6. Oscilloscope (Commercial Grade or equivalent)
7. Harmonic Distortion Analyzer (Hewlett-Packard 333A or equivalent)

STEP	ADJUST ITEM	TUNER DIAL SETTING	SIGNAL GENERATOR				INDICATOR		ADJUST	TEST LIMITS	REMARKS
			TYPE	FREQ.	COUPLING	MODULATION	TYPE	CONNECTED TO			
1	I F	Point of no interference	SWEEP Generator	10.7MHz	Through external 1PF capacitor to TP 1 (Q14G1) on Front end assembly (702-0001-00)	LINE Sweep	Oscilloscope	TP2 on IF assembly (703-0001-00)	Top (secondary) and bottom (primary) of T11 on Front end assembly (702-0002-01)	Maximum height of 10.7MHz marker and best symmetry curve as Fig. 1	Keep sweep generator output as low as possible to prevent IF waveform from over shooting the scope screen.
2	DETECTOR	Same	Received FM noise				TUNING METER		Top (secondary) of L9 on IF assembly (703-0001-00)	Midpoint indication of TUNING METER	Keep TUNER in MONO mode with MUTING at OFF for step 2 through step 9.
3	SIGNAL METER	106MHz	FM signal Generator	106MHz OUTPUT 96dB	Through antenna matching network to 300Ω ANT terminals	CW	SIGNAL METER		VR2 on IF assembly (703-0001-00)	"5" Point indication of SIGNAL METER	About 1/3 clockwise turn should produce a METER reading of "5". If unattainable repeat this step after completing step 9.
4	DETECTOR	Same	Same	106MHz	Same	400Hz ± 75KHz deviation	Oscilloscope VTVM Distortion meter	FIXED AUDIO OUTPUT	Bottom (primary) of L9 On IF assembly (703-0001-00)	Maximum audio output and minimum distortion	Adjust FM signal generator output to obtain reading of "2.5" on the SIGNAL METER at Perfect resonance, indicated by the maximum deflection of the SIGNAL METER and midpoint indication of the TUNING METER. Distortion will be less than 0.2% if a high quality FM signal generator is used.
5	AUDIO OUTPUT	Same	Same	106MHz OUTPUT 66dB	Same	Same	Same	Same	VR1 on MPX assembly (700-0001-00)	2.0V audio output	Same
6	CALIBRATION	Same	Same	106MHz	Same	Same	Same	Same	Oscillator trimmer Tce 5 on Front end assembly (704-0001-00)	Maximum SIGNAL METER. Midpoint TUNING METER	Keep FM signal generator output level the same as in step 4.
7	Same	90MHz	Same	90MHz	Same	Same	Same	Same	Oscillator coil L15 on Front-end assembly (704-0001-00)	Same	Keep repeating step 6 and 7 back and forth, until dial accurately indicates 90MHz and 106MHz during resonance with FM signal generator. Also check accuracy of other frequency reading.
8	TRACKING	106MHz	Same	106MHz OUTPUT 12dB	Same	Same	Same	Same	Tce 1, 2, 3, 4 on Front-end assembly (704-0001-00)	Adjust for minimum noise and distortion	S/N will be more than 40dB. Distortion less than 3%.
9	Same	90MHz	Same	90MHz OUTPUT 12dB	Same	Same	Same	Same	L11, 12, 13, 14 on Front-end assembly (704-0001-00)	Same	Same as above. Repeat step 8 and Check again.
10	MUTING LEVEL	Same	Same	90MHz OUTPUT 32 ~ 38dB	Same	400Hz±22.5KHz deviation			VR1, on IF assembly (703-0001-00)	ON/OFF audio output	Set MUTING switch to "2", and VR1 to maximum clockwise position. Then back off VR1 slowly in counterclockwise direction until audio output is obtained. Next set MUTING switch to "1". Reduce FM signal generator output by about 20dB around which point audio output ON/OFF should now occur. Check this.
NOTE: Since the ANT and RF circuits are double tuned, an RF sweep generator is necessary for realignment. Avoid touching parts in the cavity except for replacing parts thereof. If not audio output is obtained during step 4, see if it becomes available when an oscilloscope is connected to the DETECTOR OUTPUT. If so, it will be an indication of some trouble within the MPX assembly. The DE-EMPHASIS switch S1 within the MPX assembly (706-0001-00) should be set to 50μS or 75μS whichever conforms with the practice in the country in which this tuner is used.											
11	MULTIPLEX	100MHz	MULTIPLEX Generator FM signal Generator	100MHz OUTPUT 66dB	Same	400Hz, L-R	Same	Same	VR2 on MPX assembly (706-0001-00)	Maximum audio output and minimum distortion	Tune for perfect resonance.
12	SEPARATION	Same	Same	Same	Same	400Hz, L-R	Same	Same	VR3 on the chassis	Adjust for Maximum separation	Inverse signal and check both channels.

Keep sweep generator output as low as possible to prevent IF waveform from over-running scope screen. Push in AM DIST button. Set AM LEVEL to MAX.
2	AGC	1,000kHz	AM signal Generator	1,000kHz OUTPUT 80dB	Through external 250Ω resistor to ANT terminals.	CW	MULTI-TESTER	TP53 on IF assembly (704-0001-00)	Top and Bottom of T3 on IF assembly (704-0001-00)	Adjust for maximum (–) DC voltage	Should be at least DC-0.5V
3	CALIBRATION	1,400kHz	Same	1,400kHz	Same	30%	Oscilloscope VTVM Distortion meter	FIXED AUDIO OUTPUT	Oscillator trimmer Tca 3 on Front-end assembly (702-0001-01)	Maximum audio output	Set AM loop stick antenna in horizontal position. Keep signal generator output as low as possible.
4	Same	600kHz	Same	600kHz	Same	Same	Same	Same	Oscillator coil T52 on Front-end assembly (702-0002-01)	Same	Same as above. Repeat step 3 and 4, back and forth, until dial pointer indicates correct resonant frequencies.
5	TRACKING	1,400kHz	Same	1,400kHz	Same	Same	Same	Same	Tca 1, 2, on Front-end assembly (702-0002-01)	Same	Set signal generator output to less than 30dB.
6	Same	600kHz	Same	600kHz	Same	Same	Same	Same	T51 on Front-end assembly (702-0002-01) and AM LOOP STICK antenna.	Same	Same as above. Repeat step 5 and 6 until perfect tracking is obtained. This unit is rated at S/N 20dB against a 24dB input signal in a shielded room, provided 25 ~ 28dB input outside shielded room.
7	AUDIO OUTPUT	600kHz	Same	600kHz OUTPUT 60dB	Same	Same	Same	Same	VR1 on IF assembly (704-0001-00)	0.6V audio output	Check distortion. It should be less than 0.5% if a highquality signal generator is used.
8	SIGNAL METER	600kHz	Same	600kHz OUTPUT 90dB	Same	CW	SIGNAL METER		VR2 on IF assembly (704-0001-01)	"5" point indication of SIGNAL METER	

NOTE: Sensitivity will drop about 20dB if the AM LOCAL button is depressed in place of the DIST button.

Use of transistors other than specified will adversely affect performance and should be avoided.

## THE MARK OF CAPACITOR AND RESISTORS ON THE SCHEMATIC DIAGRAM

- : CERAMIC CAPACITORS
- ⊖: MICA CAPACITORS
- ⊗: TANTALUM SOLID CAPACITORS
- : METALLIZED FILM CAPACITOR
- ⊕: POLYSTYRENE FILM CAPACITORS
- ⊙: MYLAR FILM CAPACITORS

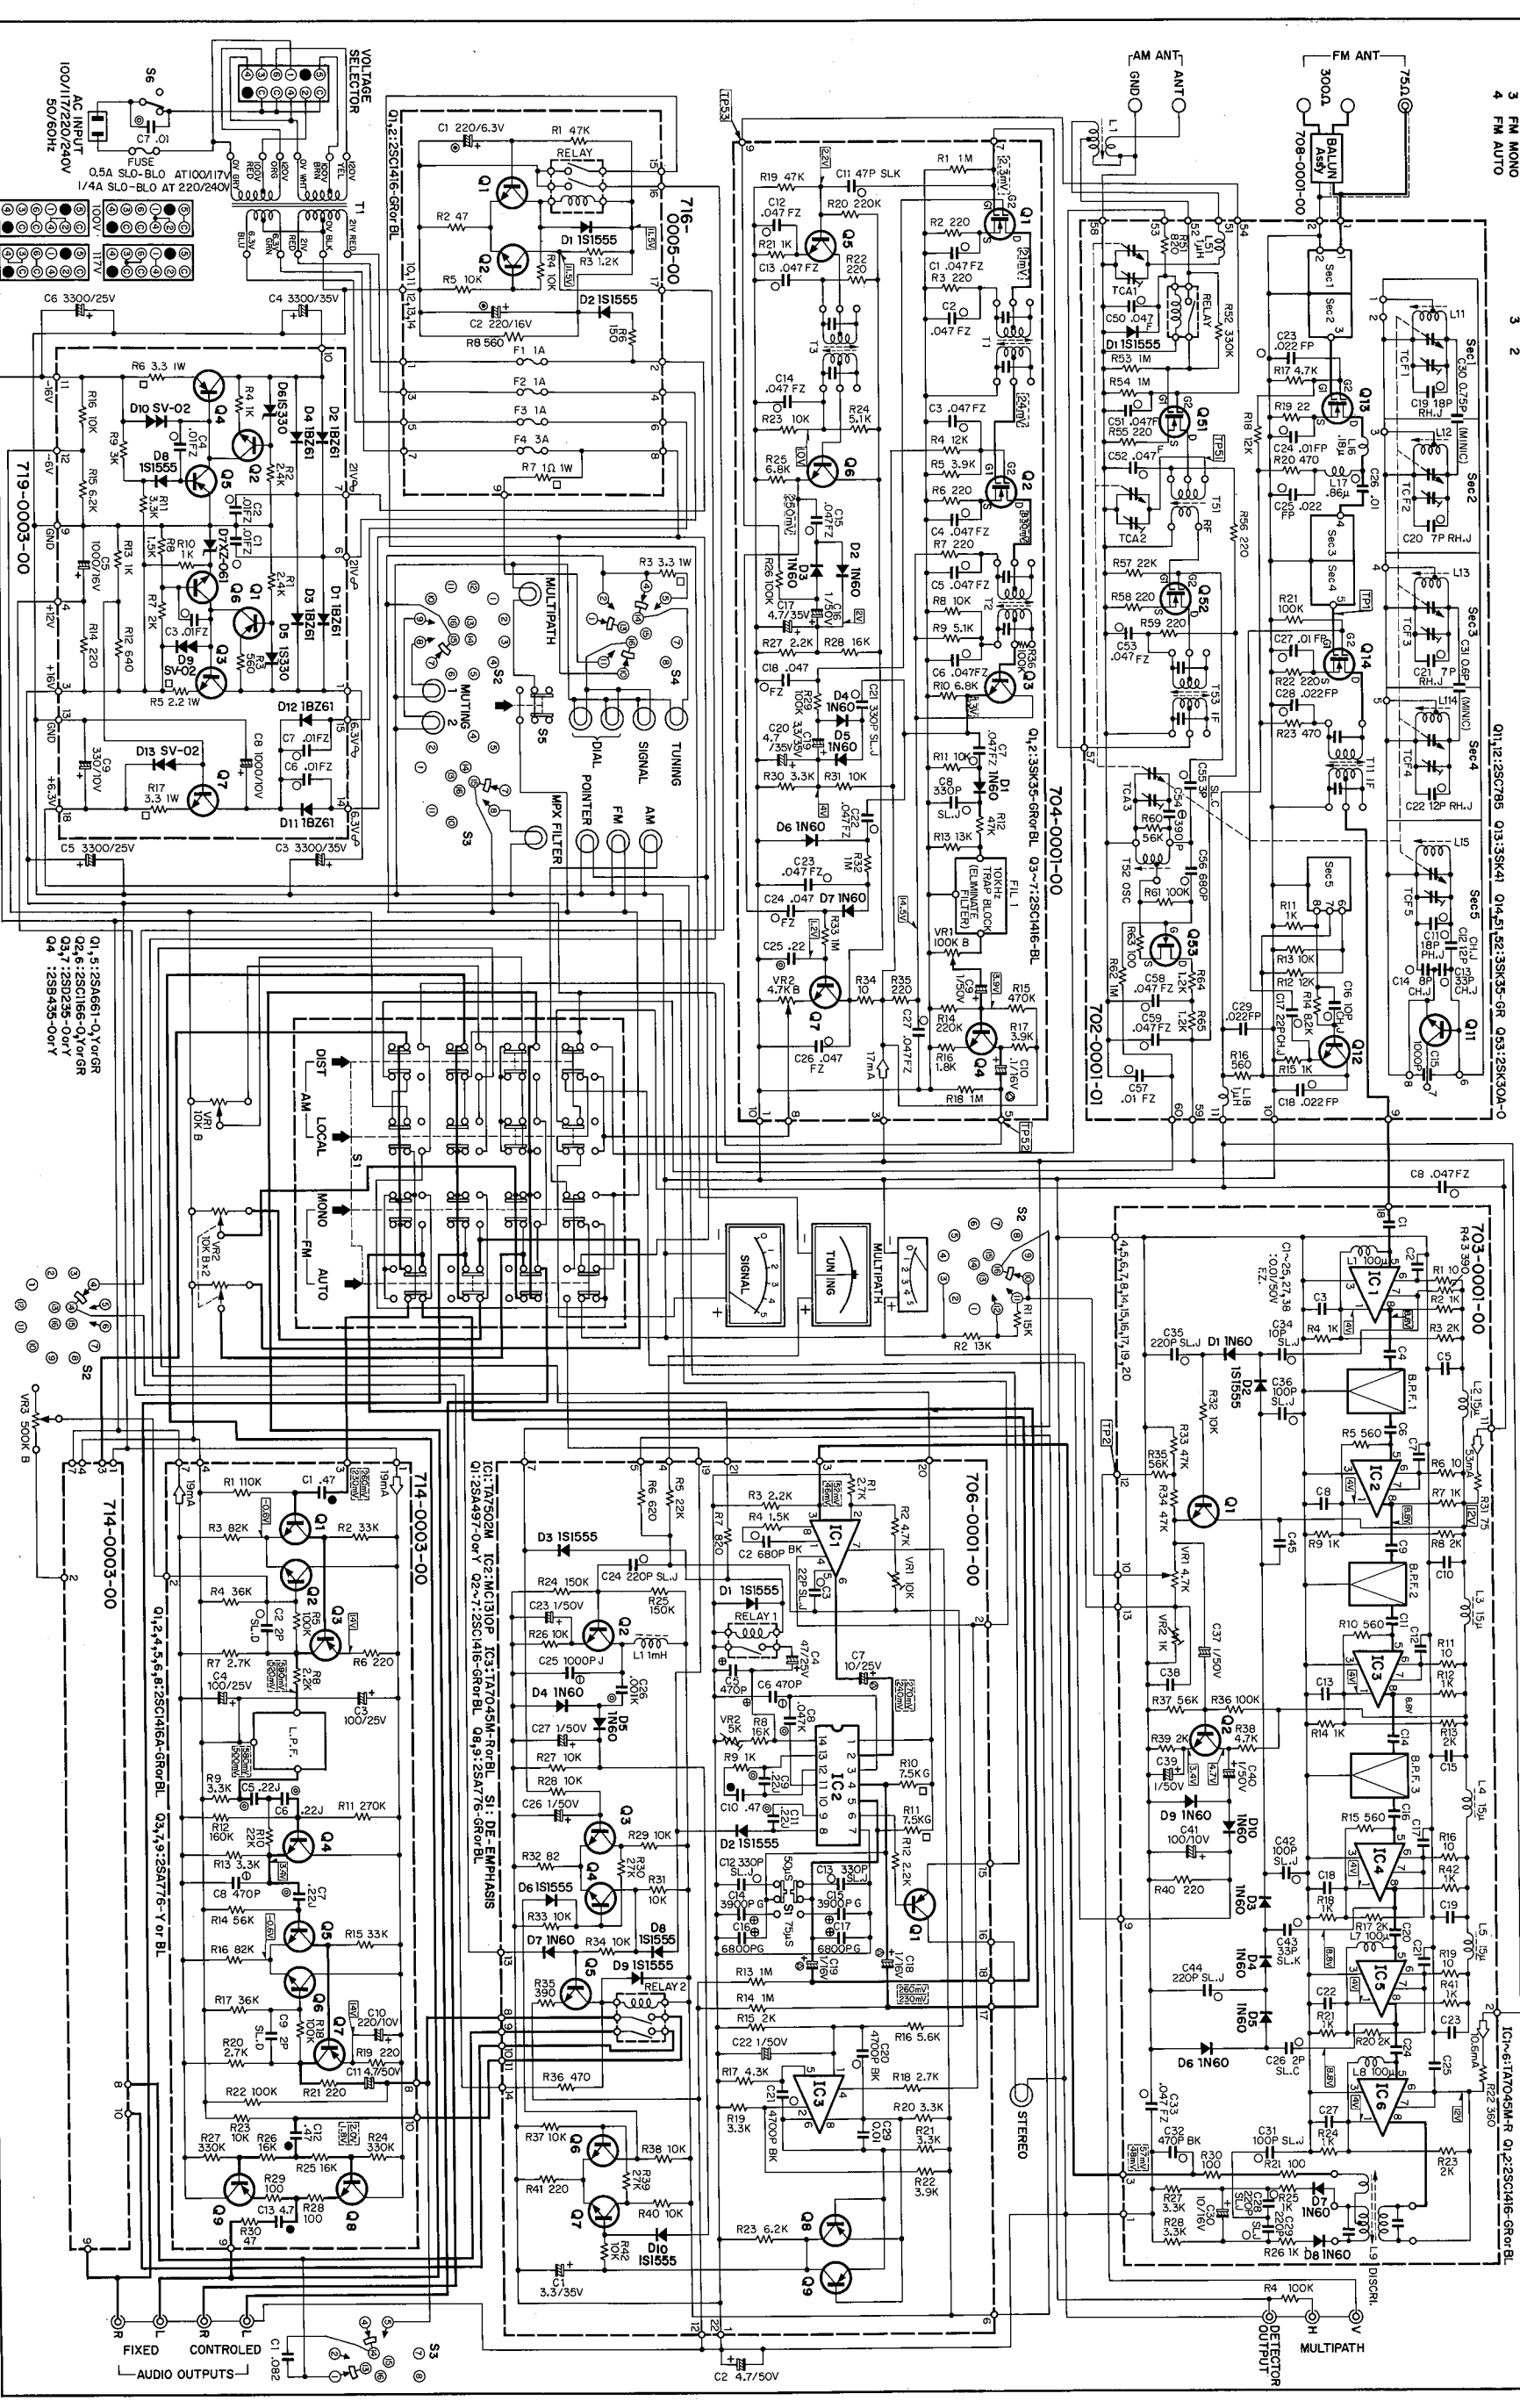

- : METAL FILM RESISTORS
- : OXED METAL FILM RESISTORS
- ▣: CEMENT COATED WIRE WOUND RESISTORS
- ▤: CEMENT COATED METAL PLATE RESISTORS

Unless other wise specified: Capacitors are ELECTROLYT-IC Types: Resistors are CARBON FILM Types, 1/2 watt, and ±5% tolerance;

Indicated values of parts in the schematic diagram may be changed in case of performance improvement.

# SPECIFICATIONS

PERFORMANCE GUARANTY: Products of Kensonic guarantee specifications stated.

- FM MONOPHONIC Performance:

SENSITIVITY:

2.0  $\mu$ V IHF  
2.0  $\mu$ V for 40 dB of quieting.  
4.5  $\mu$ V for 50 dB of quieting.  
75 dB at 200  $\mu$ V input.

ULTIMATE S/N:

ULTIMATE THD: at 50 $\mu$ V input, 100% modulation.

100Hz: will not exceed 0.1 %  
1,000Hz: will not exceed 0.1 %  
10,000Hz: will not exceed 0.1 %  
will not exceed 0.2 % (Antenna input 1 mV, 100 % Mod, 70 Hz : 7 kHz = 4:1)  
+0, -1 dB 20 Hz to 15,000Hz
