Low Power/Fast MODE alternative 200mA LDO REGULATOR

NO.EA-279-120410

OUTLINE

The RP202x Series consist of CMOS-based voltage regulator ICs with high output voltage accuracy, low dropout voltage and low supply current. These ICs perform with the chip enable function and realize a standby mode with ultra low supply current. To prevent the destruction by over current, the current limit circuit is included. The RP202 Series have 3-mode. One is standby mode with CE pin. The other two are the fast response mode (Fast Mode) and the low power mode, and switch over automatically according to the load current of the LDO. Supply current of IC itself at light load is automatically reduced. The output voltage is maintained between Fast Mode and ECO Mode.

The RP202x consists of a voltage reference unit, an error amplifier, a resister net for voltage setting, and a current limit circuit.

Since the packages for these ICs are SOT-23-5, SC-88A, and DFN(PLP)1010-4, high density mounting of the ICs on boards is possible.

FEATURES

- ●Input Voltage Range ..... 1.4V to 5.25V
- ●Output Voltage Range ..... 0.8V to 4.0V (0.1V steps)
  (For other voltages, please refer to MARK INFORMATIONS.)
- ●Supply Current (I_{OUT}=0mA) ..... Typ. 2.5μA
- ●Supply Current (I_{OUT}=10mA) ..... Typ. 50μA
- ●Supply Current (Standby Mode) ..... Typ. 0.1μA
- ●Dropout Voltage ..... Typ. 0.20V (I_{OUT}=200mA, V_{OUT}=2.8V)
- ●Ripple Rejection ..... Typ. 70dB (f=1kHz, V_{OUT}=2.8V, I_{OUT}=30mA)
- ●Line Regulation ..... Typ. 0.02%/V (I_{OUT}=10mA)
- ●Packages ..... DFN(PLP)1010-4, SC-88A, SOT-23-5
- ●Built-in Foldback Protection Circuit ..... Typ. 60mA (Current at short mode)
- ●Ceramic capacitors are recommended to be used with this IC ..... 0.47μF or more

APPLICATIONS

- ●Power source for portable communication equipment.
- ●Power source for electrical appliances such as cameras, VCRs and camcorders.
- ●Power source for battery-powered equipment.

SELECTION GUIDE

The output voltage, auto discharge function, and package, for the ICs can be selected at the user's request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
RP202Kxx1∗-TR	DFN(PLP)1010-4	10,000pcs	Yes	Yes
RP202Qxx2∗-TR-FE	SC-88A	3,000pcs	Yes	Yes
RP202Nxx1∗-TR-FE	SOT-23-5	3,000pcs	Yes	Yes

xx: The output voltage can be designated in the range from 0.8V(08) to 4.0V(40) in 0.1V steps.
(For other voltages, please refer to MARK INFORMATIONS.)

∗ : The auto discharge function at off state are options as follows.
(B) without auto discharge function at off state
(D) with auto discharge function at off state

Auto-discharge function quickly lowers the output voltage to 0V, when the chip enable signal is switched from the active mode to the standby mode, by releasing the electrical charge accumulated in the external capacitor.

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

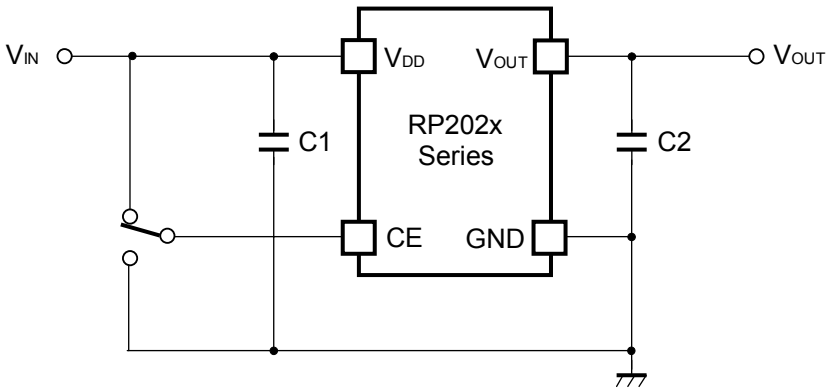
TYPICAL APPLICATION



(External Components)

C1, C2 : Ceramic Capacitor 0.47μF MURATA: GRM155B31A474KE14

TECHNICAL NOTES

When using these ICs, consider the following points:

Phase Compensation

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, use a capacitor C2 with 0.47μF or more and good ESR (Equivalent Series Resistance).

(Note: If additional ceramic capacitors are connected with parallel to the output pin with an output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

PCB Layout

The impedances of V_{DD} line and GND line has to be low as possible. The high impedances may result in the unstable operation or a noise pickup. The output capacitor with 0.47μF or more should be placed between V_{DD} and GND. The line from V_{DD} to the output capacitor, and the line from the output capacitor to GND must be wired as short as possible.

The output capacitor is placed between V_{OUT} and GND as phase compensation. The line from V_{OUT} to the output capacitor, and the line from the capacitor to GND must be wired as short as possible. Please refer to the “Basic Test Circuit” below.

RICOH COMPANY, LTD. Electronic Devices Company

■Ricoh presented with the Japan Management Quality Award for 1999.
Ricoh continually strives to promote customer satisfaction, and shares the achievements of its management quality improvement program with people and society.

■Ricoh awarded ISO 14001 certification.
The Ricoh Group was awarded ISO 14001 certification, which is an international standard for environmental management systems, at both its domestic and overseas production facilities. Our current aim is to obtain ISO 14001 certification for all of our business offices.

RoHS Compliant
Ricoh completed the organization of the Lead-free production for all of our products. After Apr. 1, 2006, we will ship out the lead free products only. Thus, all products that will be shipped from now on comply with RoHS Directive.
